

geany

[editor](#), [LaTeX](#), [geany](#)

un éditeur php léger et pratique

juste excellent, simple de lier des formats de fichiers ctp → php, colorations syntaxique, repérage des classes et fonctions, ereg, many files ereg...

<http://www.geany.org/>

[Geany pour LaTeX](#)

install

```
sudo apt-add-repository ppa:geany-dev/ppa
sudo apt-get update
sudo apt-get install geany
```

```
sudo apt-get install geany-plugin-addons geany-plugin-gdb geany-plugin-latex geany-plugin-lipsum
geany-plugin-lua geany-plugin-sendmail geany-plugin-shiftcolumn geany-plugin-spellcheck geany-
plugin-vc geany-plugins geany-plugins-common
```

User-definable snippets

<http://www.geany.org/manual/current/#user-definable-snippets>

Snippets are small strings or code constructs which can be replaced or completed to a more complex string. So you can save a lot of time by not typing often used strings and letting Geany do the work for you. To know what to complete or replace Geany reads a configuration file called snippets.conf at startup.

The system-wide configuration file can be found in \$prefix/share/geany, where \$prefix is the path where Geany is installed (see Installation prefix). It is not recommended to edit the system-wide file, because it will be overridden when Geany is updated.

To change the settings, copy the file from \$prefix/share/geany in your configuration directory (usually `~/.config/geany/`).

For example:

```
% cp /usr/local/share/geany/snippets.conf /home/username/.config/geany/
```

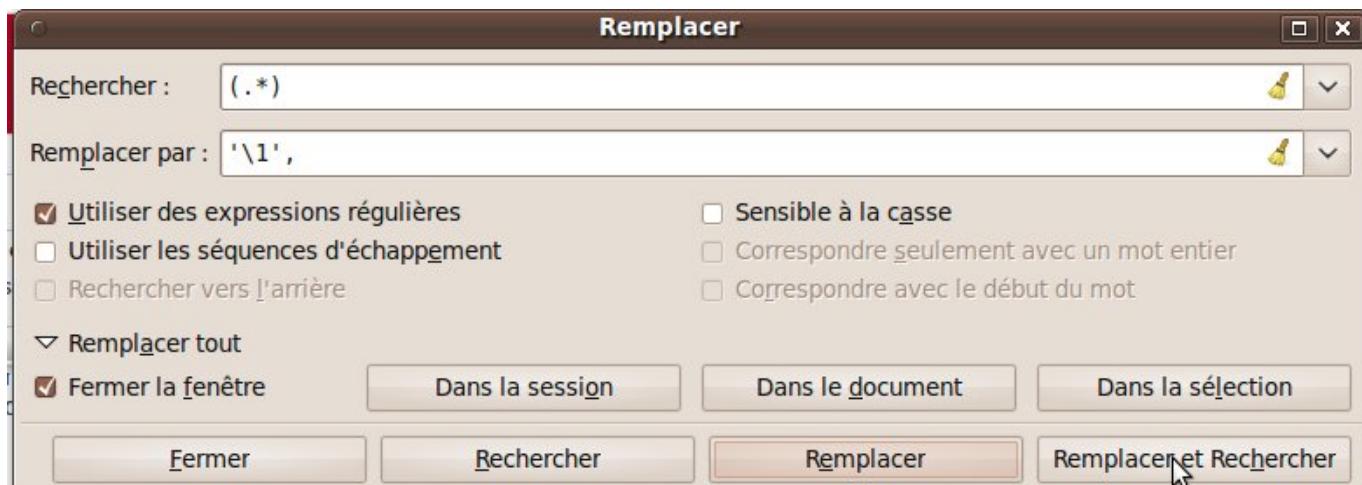

Then you can edit the file and the changes are also available after an update of Geany because the file resides in your configuration directory. Alternatively, you can create a file `~/.config/geany/snippets.conf` and add only these settings you want to change. All missing settings

will be read from the global snippets file in \$prefix/share/geany.

Ereg / Regexp / Expressions régulières

```
^( .*)$  
\1
```

Sort / tri / trier des lignes avec geany

source: <http://crunchbang.org/forums/viewtopic.php?id=24607>

- 01) From the menu bar, select Edit - Format - Send Selection to - Set Custom Commands.
- 02) Click the Add button in the Set Custom Commands window.
- 03) Enter sort in the command field and then click the OK button.
- 04) Select the text that you want to sort.
- 05) Right-click on the selected text and select Format - Send Selection to - sort to sort the selected text.

Tips / Astuces

How to solve: Geany tried to access the Unix Domain socket of another instance running as another user. This is a fatal error and Geany will now quit?

```
cd ~/.config/geany/  
sudo rm geany_socket_ubuntu_0
```
