linkchecker

un outil très pratique pour tester les liens de son site, en ligne de commandes, nombreux exports possibles Check websites for broken links

LinkChecker is a free, GPL licensed URL validator.

http://wummel.github.io/linkchecker/

Exemple

```
 #rendu html
 linkchecker https://radeff.red/blog --output=html > ~/checklinks.html
 #rendu csv
 linkchecker https://radeff.red/blog --output=csv > ~/checklinks.csv

 -oTYPE[/ENCODING], --output=TYPE[/ENCODING]
  Specify output type as text, html, sql, csv, gml, dot, xml, sitemap, none
or blacklist. Default type is text. The various output types are documented
below.
  The ENCODING specifies the output encoding, the default is that of your
locale. Valid encodings are listed at
http://docs.python.org/library/codecs.html#standard-encodings.
  use --check-extern to check extern URLs.
```

Doc

http://linkchecker.sourceforge.net/man1/linkchecker.1.html

ATTENTION!

Par défaut, linkchecker lance une récursion infinie... Si votre site est gros, cela peut vite devenir une sacrée usine à gaz:

```
-rNUMBER, --recursion-level=NUMBER
    Check recursively all links up to given depth. A negative depth will
enable infinite recursion. Default depth is infinite.
```

Pour limiter à un seul namespace, utiliser l'option **-r1** :

```
 linkchecker -r1 https://radeff.red/recettes/restaurants --output=html >
~/checklinks.html
```
